Information from Storage Magazine, January 2007

Data Protection Set to Explode

The managed storage industry is expected to surge in 2007 as businesses of all sizes pursue more simplified and centralized IT infrastructures that ensure business continuity and regulatory compliance. Increasingly complex storage systems and growing IT assets located in public and private data centers are expected to spur growth for storage services through 2008, bringing the worldwide opportunity to nearly \$30 billion.

Organizations seeking automated data protection have found it difficult to implement an efficient, reliable solution, and are challenged with increasing requirements to make data backup more secure and compliant. The NetMass solution provides a fully-automated approach that is easy to deploy, and helps businesses reduce their operational expenditures with a robust, industry-tested solution.
